

```

        basicstyle=\ttfamily, columns=fullflexible, keepspaces=true
: paxos.learn ( addr n v -- Ethernet packet )
    2 paxos.pack32      ( addr n v -- addr payload )
    paxos.eth_type.learn ( addr payload -- addr payload ethtype )
    swap paxos.eth_packet ; ( addr payload ethtype -- ethernet_packet )

```

This is verbatim (and what I want):

```

: paxos.learn ( addr n v -- Ethernet packet )
    2 paxos.pack32      ( addr n v -- addr payload )
    paxos.eth_type.learn ( addr payload -- addr payload ethtype )
    swap paxos.eth_packet ; ( addr payload ethtype -- ethernet_packet )

```
